

HyrHub Backend Engineer (Python, Golang) - What to Learn

MUST Learn (Class A keywords with no direct project experience)

- **Python for backend APIs** – you know Python from CS fundamentals/study, but have no repo-backed backend API work in it (your production API work is Node.js/Express). Bridge: your Express route-handler and REST design experience maps directly onto Flask or FastAPI – routes, request/response objects, and middleware all have close analogues. Build one small REST API in Flask or FastAPI to have a concrete Python backend project to point to.
- **Go (Golang), as the alternative path** – the JD accepts EITHER Python or Go, so this is optional if you lead with Python, but worth a light touch since it's explicitly named. Basics: goroutines/channels for concurrency, and Go's net/http package for a minimal API server – lower priority than Python here since the JD phrasing ("Python or Go") lets you choose your stronger option.
- **Object-Oriented Programming fundamentals, applied** – you understand OOP conceptually, but this JD wants it demonstrable in interviews. Review core OOP: encapsulation, inheritance, polymorphism, and how they show up in class design for a backend service (e.g. modeling domain entities), since interview questions at this level often probe OOP design directly.

GOOD to Learn (strengthens the application, not blocking)

- **Linux-based development environments, applied** – you're already a daily Linux user (Fedora), so this is mostly about being ready to discuss shell scripting, process management, and basic systems administration in a backend-dev context (log inspection, service restarts, environment variables) rather than new material.
- **Database concepts, deeper** – you have real SQL experience (Skimly's hand-written schema, Prisma across multiple projects). Round this out with normalization forms, indexing strategy, and transaction isolation levels, since "database concepts" at an interview level often means these fundamentals rather than ORM usage.

Fast-Ramp Note

This is one of your stronger-matching JDs: the role explicitly accepts Python OR Go (not both), targets 0-2 years experience (internships/projects count), and leans heavily on DSA, OOP, REST APIs, and database fundamentals – all areas where you have genuine strength (6-star CodeChef, 1000+ DSA problems, hands-on REST API design at Clink AI). The one gap worth closing before an interview is a small Python (or Go) backend project, since your current backend work is entirely in Node.js/Express – everything else on this JD you can speak to directly today.
