

Weetech Consultants Python Full Stack Developer - What to Learn

MUST Learn (Class A keywords with no direct project experience)

- **Django, Flask, and FastAPI** – three Python web frameworks with no repo backing (your production backend work is Node.js/Express). FastAPI is your fastest bridge – async route handlers and Pydantic validation map almost 1:1 onto Express middleware and the Zod schemas you already use. Flask is minimal and unopinionated, closest to plain Express. Django is the batteries-included option (ORM, admin panel, URLconf). Build one small REST API in FastAPI first (fastest ramp given your async/Node background), then skim Flask and Django to recognize their patterns in an interview.
- **AngularJS (1.x)** – the legacy (pre-2016) Angular. Uses two-way data binding, \$scope, controllers, and directives – a different mental model from React’s one-way data flow. Since it’s a legacy framework, the 20% to know: modules, controllers, **ng-repeat/ng-model**, and services/factories. Lower priority than the Python frameworks since your React experience is much stronger and likely the more relevant frontend skill in practice.

GOOD to Learn (strengthens the application, not blocking)

- **Financial/trading platform domain knowledge** – the JD mentions ”financial/trading platform development.” You have no direct fintech experience; skim basic concepts (order types, market data feeds, settlement) so you can speak to the domain in an interview, even though this is business knowledge rather than a coding skill.
- **AI/ML concepts within applications** – your genuine strength is LLM/agent AI (RAG, tool calling, prompt engineering via Echo/Vibe), which likely satisfies this JD’s ”implement AI/ML concepts or tools” ask directly, especially in a trading context where AI-assisted analysis or chat interfaces are common. No separate prep needed here – lead with what you already have.

Fast-Ramp Note

Your core strengths (React.js, JavaScript/TypeScript, REST API design, SQL/NoSQL databases, and genuine LLM/agent AI experience) cover a meaningful chunk of this JD directly. The real gap is the Python web framework layer (Django/Flask/FastAPI) – Python itself is familiar to you, but you have no framework-level backend project in it. Build one small FastAPI service before interviewing, since ”Python (backend)” is this JD’s headline requirement, not just a nice-to-have.
