

HyrHub Back End Engineer (Python, Golang) - What to Learn

MUST Learn (Class A keywords with no direct project experience)

- **Go (Golang), at a 2-4 year professional depth** – this listing wants deeper backend fluency than the entry-level HyrHub posting you tailored for earlier; you'll want a real Go project, not just Python. Build a small REST service in Go (using `net/http` or Gin) with goroutines/channels for one concurrent task, since "2-4 years backend development with Python OR Golang" implies genuine hands-on depth in at least one.
- **Distributed systems, applied** – this JD explicitly wants "solid understanding of RESTful APIs, microservices, and distributed systems." You understand microservices-style architecture conceptually (Echo's multi-tenant monorepo), but distributed-systems specifics (consistency models, service discovery, distributed tracing) are a deeper ask at 2-4 YOY than at entry level. Review core concepts: CAP theorem, eventual consistency, and how services communicate reliably across a network.
- **NoSQL databases, hands-on** – you have PostgreSQL and MongoDB familiarity, but this JD wants explicit "relational and NoSQL databases" fluency at a professional level. Make sure you can speak to when you'd choose one over the other (schema flexibility, horizontal scaling, consistency trade-offs) beyond just having used MongoDB in a project.

GOOD to Learn (strengthens the application, not blocking)

- **Cloud concepts beyond AWS** – you have real AWS experience (Secrets Manager in Echo); this JD lists AWS/GCP/Azure as options. Skim GCP/Azure's equivalent core services (compute, secrets/config management) so you can discuss cloud concepts generally, not just AWS specifics.
- **AI-powered development tools – already a strength.** This JD explicitly asks for "familiarity with AI-powered development tools or exposure to projects" – you are a genuine daily user of Claude Code and Cursor. No prep needed here; lead with this confidently, since it's an explicit ask many candidates won't have as naturally.

Fast-Ramp Note

This listing (2-4 years) asks for more hands-on depth than the earlier HyrHub 0-2 year posting at the same company – particularly in Go specifically (not just "Python or Go" flexibility) and distributed-systems understanding. Your DSA/algorithms fundamentals (6-star CodeChef, 1000+ problems) and REST API design experience remain strong differentiators. Prioritize a small Go project with real concurrency before interviewing, since depth in at least one of Python/Go (not just familiarity) is what separates this listing from the entry-level one.
