

Adsremedy Media LLP Backend Developer (Golang) - What to Learn

MUST Learn (Class A keywords with no direct project experience)

- **Go (Golang)** – the single biggest gap: this JD wants 3+ years hands-on Go, and your production experience is entirely JavaScript/TypeScript/Python. Go is statically typed and compiled, with goroutines/channels for concurrency instead of async/await. Bridge from your Express.js route-handler experience – Go’s net/http and popular routers (Gin, Echo) follow a similar request/response mental model. Given the depth this JD wants (3+ years), be direct about this gap in interviews rather than overselling it.
- **Columnar OLAP databases (Druid, ClickHouse)** – analytics-optimized databases for fast aggregation queries over large datasets, as opposed to the row-oriented PostgreSQL/MySQL you know. Bridge from your Mixpanel dashboard work (Clink AI) – you already think in terms of aggregating events for dashboards; OLAP databases are the infrastructure layer beneath that kind of analytics.
- **OLTP databases (ScyllaDB, Redis)** – ScyllaDB is a high-throughput, low-latency NoSQL database (Cassandra-compatible) built for OLTP workloads at scale. You know Redis already (caching context); ScyllaDB is the new piece – conceptually closer to MongoDB (document/wide-column model) than to PostgreSQL.
- **Distributed systems & concurrency at depth** – this JD wants deep expertise here, beyond what Inngest’s background-job model (Vibe) covers. Core topics: consistency models, leader election, partitioning/sharding, and Go’s goroutine/channel concurrency primitives specifically.

GOOD to Learn (strengthens the application, not blocking)

- **Kafka / RabbitMQ** – message queue systems for decoupling services. Conceptually similar to Inngest’s durable background jobs (Vibe), but at a lower level – you’d be running and configuring the broker yourself rather than using a managed service.
- **Monitoring tools (Prometheus, Grafana, ELK)** – production observability stack. You have real monitoring experience via Sentry (crash reporting) and Mixpanel (analytics) – the new piece is metrics/log aggregation infrastructure rather than application-level error tracking.
- **Team leadership / mentoring at a management level** – you have genuine mentoring experience (Technical Mentor achievement, 100+ students), which is a real signal, though this JD’s ”proven team leadership or management experience” implies formal reports, which is a bigger gap to close with time and title.

Fast-Ramp Note

This JD explicitly wants 6+ years of experience including 3+ years hands-on Go and team leadership – a senior bar significantly above your current experience level. Your RESTful API design, database work, Docker/containerization (Vibe’s E2B sandbox), and CI/CD experience are real and transferable, but Go itself and the OLAP/OLTP database stack are ground-up learning. If you pursue this role, lead with your systems-design thinking (Echo’s multi-tenant architecture, Vibe’s agentic pipeline) and be upfront that Go is a language you’re picking up rather than years-deep in.
