

Propsoch Frontend Engineer - What to Learn

Technical SEO (MUST)

- What it is: making a site's structure, markup, and performance easy for search engines to crawl, index, and rank – distinct from content/keyword SEO.
- Why the JD wants it: the role explicitly calls out "enhancing technical SEO to expand homebuyer reach" and lists strong SEO rankings as a success metric.
- The important 20%: Next.js's built-in SEO tools – `next/head` / the App Router `metadata` API for title/description/OG tags, `next/image` for optimized images (Core Web Vitals), server-side rendering (SSR) and static generation (SSG) for crawlable HTML, `sitemap.xml` & `robots.txt` generation, canonical URLs, and Lighthouse/PageSpeed audits for Core Web Vitals (LCP, CLS, INP).
- Bridge from your background: you already improved page load speed by 30% at Clink AI and have shipped multiple Next.js apps (Echo, Vibe) – SEO is largely about applying Next.js's SSR/metadata primitives you've already touched, plus learning to read a Lighthouse report.

SEM & Conversion Metrics (GOOD)

- What it is: Search Engine Marketing – paid search/landing-page optimization – and the broader discipline of tracking how site changes affect conversion rates.
- Why the JD wants it: success metrics include "improved conversion metrics" alongside SEO rankings, implying frontend changes are expected to be measured against business outcomes.
- The important 20%: how landing-page speed, layout, and CTA placement affect conversion; basic familiarity with Google Analytics / Search Console; connecting frontend changes to measurable funnels.
- Bridge: you already instrumented 400+ Mixpanel events across 25+ user flows powering funnel/retention reports at Clink AI – this is the same instinct (frontend change -> measurable funnel impact), applied to a different tool (GA/Search Console vs. Mixpanel).

Figma & Product Design Collaboration (GOOD)

- What it is: reading and implementing designs directly from Figma files, and collaborating with (or acting as) a product-minded designer on UX decisions.
- Why the JD wants it: the JD lists "Product Design" and "Figma" as core skills, reflecting a small-team setup where engineers own more of the design-to-code pipeline.
- The important 20%: reading Figma auto-layout & spacing tokens, using Figma's Inspect panel to pull exact CSS values, and enough design vocabulary (spacing scale, typography hierarchy, component states) to make small UX calls independently without a dedicated designer.
- Bridge: you already build UI from scratch with Tailwind CSS across Clink AI, Echo, and Vibe – Figma-to-code is the same skill with a design file as the spec instead of a verbal requirement.

Priority Summary

- **MUST:** Technical SEO fundamentals in Next.js (metadata API, SSR/SSG, Core Web Vitals).
- **GOOD:** SEM/conversion-metric literacy (GA/Search Console basics); Figma-to-code workflow.
