

Infoskaters AI Developer - What to Learn

Priority: MUST Learn (Class A keywords added to your resume)

- **LangChain (deepen beyond shallow use)** — the JD lists LangChain as preferred, and you have light exposure (a single PDFLoader call in your Skimly project, no chains or agents built with it). Learn LangChain’s core abstractions: chains (sequencing LLM calls), retrievers, and its agent/tool-calling pattern — you already understand tool calling conceptually from Echo/Vibe, so this is mostly learning LangChain’s specific API surface. The official “LangChain Quickstart” (2-3 hours) covers the essential 20%.
- **API integration and evaluation (formalize what you already do)** — you already integrate LLM APIs (OpenAI, Gemini) and build tool-calling integrations (Echo’s 3 Zod-typed tools). The JD wants you to also frame this as “evaluation” — learn the vocabulary for comparing model outputs (latency, cost per call, accuracy/hallucination checks) since that’s the part you haven’t explicitly done yet.
- **Machine Learning (ML) fundamentals** — as with your other AI-focused applications, this JD wants general ML literacy even though your background is applied GenAI. Learn: supervised vs. unsupervised learning, train/test split, and overfitting. Andrew Ng’s “Machine Learning Specialization” intro module (audit free) is the fastest path.
- **Automation (as a formal skill, not just a side-effect)** — you already automate things (EAS CLI builds, OTA delivery, Mixpanel event pipelines) but haven’t framed it explicitly. Learn to talk about scripting/workflow automation (e.g. simple Python scripts, cron-style scheduled tasks, webhook-triggered flows) since “build automation solutions” is a literal JD ask.

Good to Know (Class B — best-effort, strengthens your fit)

- **Cloud platforms (mentioned as preferred)** — you already have genuine AWS Secrets Manager experience (Echo); a light skim of Azure’s equivalent services rounds this out if asked.
- **Chatbot design patterns** — you’ve built one (Echo), so review common chatbot UX patterns (fallback handling, conversation state, escalation to human) so you can speak generally, not just about your specific implementation.
- **Testing AI applications** — the JD wants you to “test, optimize, and maintain AI applications.” Learn the basics of prompt regression testing (comparing outputs before/after a prompt change) as a lightweight practice you can describe.

How this maps to your background

This JD is a strong match for your applied GenAI experience: you already build the exact things it asks for (AI-powered chatbots, LLM tool calling, API integrations) via Echo and Vibe. The main gaps are (1) LangChain specifically as a named framework versus your shallow PDFLoader-only usage, and (2) classical ML vocabulary you haven’t needed for LLM-API-based engineering. Spend your prep time on the LangChain quickstart first (highest keyword weight and closest to a real skill gap), then the ML/automation vocabulary if time remains — your production chatbot and agent work will carry the interview itself.
