Hiring Team

Bristol Myers Squibb

Associate Software Engineer (Job ID: R1605676)

Dear Hiring Team,

I'm excited to apply for the Associate Software Engineer role supporting AI/ML and Decision Intelligence solutions at Bristol Myers Squibb. As a B.Tech graduate from NIT Prayagraj with hands-on experience building RAG pipelines, vector search, and agentic AI workflows in production, I'm drawn to the opportunity to bring that experience into an enterprise decision-intelligence setting.

I've built a multi-tenant B2B AI platform (Echo) with a RAG pipeline over Gemini vector embeddings and Convex vector search for semantic search, plus an agentic AI support workflow using structured LLM tool calling. In a second project (Vibe), I architected an autonomous agentic AI loop that iteratively writes, executes, and self-corrects code inside a Docker-based sandbox – directly relevant to the agentic AI workflows this role calls for.

I'm comfortable with Python and SQL for data transformation, and I'm quickly getting up to speed on LangGraph and Aera-style decision-flow concepts to round out my readiness for this role's specific platform. I enjoy collaborating with cross-functional teams and have strong analytical instincts from solving 1000+ DSA problems.

Why I'm a fit for Associate Software Engineer at Bristol Myers Squibb:

- Built a production RAG pipeline with vector embeddings and semantic search (Echo), plus an agentic AI support workflow using structured LLM tool calling.
- Architected an autonomous agentic AI loop (Vibe) with Docker-based sandboxing, directly matching the JD's agentic AI and containerization asks.
- 6-star CodeChef (2200+ rating, peak 2212) and 1000+ DSA problems solved, reflecting strong analytical thinking and problem-solving ability.
- Fast ramp-up ability: daily use of Git, REST APIs, and AWS (Secrets Manager), with quick pickup of new frameworks like LangGraph.

Sincerely,

Rajat Gangwar
