

Enlight Now Healthcare Fullstack Developer - What to Learn

MUST Learn (Class A keywords with no direct project experience)

- **Django** – Python’s batteries-included web framework (models, views/URLconf, templates, admin panel, ORM). You know Python conceptually but have no Django project. Bridge from Express.js/Prisma: Django URLconf $\approx$ Express routes, Django ORM $\approx$ Prisma models, Django views $\approx$ Express route handlers. Build one small CRUD app with Django + Django REST Framework to have a concrete project to point to – this is the single biggest gap for this JD since it’s named first alongside Python.
- **Team leadership / engineering management** – the JD wants ”experience leading engineering teams,” which is a different scope from your genuine mentoring experience (Technical Mentor achievement, 100+ students trained). Mentoring individuals is real and worth leading with; formal team-lead/EM scope (sprint planning, performance reviews, hiring) is a gap to be upfront about if it comes up.

GOOD to Learn (strengthens the application, not blocking)

- **Healthcare domain context** – Enlight Now Healthcare builds ”secure systems that enhance customer experiences” in a healthcare context. Skim basic healthcare-data considerations (HIPAA-adjacent concepts like PII/PHI handling, even if India-specific regulations differ) so you can speak to security-mindedness in an interview, since the JD emphasizes ”secure, scalable applications.”
- **GCP specifics** – you have real AWS experience (Secrets Manager in Echo); GCP is named as an alternative cloud option. The concepts transfer (managed compute, IAM, storage); worth a quick comparison read of GCP’s equivalent services (Cloud Run, Secret Manager) if this JD’s stack turns out to be GCP-based.

Fast-Ramp Note

This is a solid match on the frontend and fundamentals side – Next.js, React, TypeScript, PostgreSQL, and REST/Web API design are all genuine strengths from your Echo and Vibe projects. The one real gap is Django itself (framework-specific, not just ”Python”) – build one small Django project before interviewing, since it’s the JD’s named backend framework, not just a nice-to-have language.
